1. GENERAL INFORMATION

1.1. Introduction

SVPF-A systems are packages of one duty and one stand by line. Each line consist a horizontal screw pump type KHVP-A, a filter type FZK, a valve at inlet side and a valve at discharge side. Very easy is to close or open the lines, or dismantling of equipment.

Three screw pumps belong into the group of volumetric types of pumps. Main working elements of the pump are three screw (helical) spindles (with special profile) and a sleeve (casing). The screw spindle can be compared with gear that have big screw length of his teeth or with piston pump who have indefinite number of pistons.

As the screw rotate, the fluid continuously moves in an axial direction from the suction to the discharge side. Fluid is moving axially without turbulence and mixing which enables pumping of a lot of viscous fluids without making foam.

Working volume remains constant and moves from suction to the discharge chamber, with what continuous flow can be accomplished. This results in smooth, pulsation free flow with extremely low noise and vibration levels which is impossible to be achieved by any other design of positive displacement pumps.

1.2. Application

SVPF-A systems of screw pumps are used for transport of viscous fluids with lubricating properties, without abrasive substances and chemically not aggressive for pump materials, such as: lube oils, fuel oils, synthetic, mineral and vegetable oils, etc. The viscosity range of fluids that can be transported with three screw pumps varies from 2 to 100⁰E (11.8-760 cSt).

These types of pumps are suitable for application in the field of petrochemical industry, food industry, marine and offshore applications such as fuel-injection, oil burners, boosting, hydraulics, lubrication, circulating, transfer etc.

Typical applications are: lubrication of machines, motors, turbines; supply and circulation of fuel oil for diesel engines, burners, transfer, loading and unloading of lubrication oil, fuel oil etc.
